JOURNAL	
COMMENT	Notes: Details of yeast sequencing at the Sanger Centre are available on
	URL, http://www.sanger.ac.uk/Projects/S_pombe) Protein coding regions (CDS) have been predicted with the help of computer analysis using the Genefinder program in PomBase (an ACEDB
_	database) with additional predictions for the branch-acceptor sites

                                                                                                                                                                        Complementary strand.

The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous.

The length in codons is given for each CDS.

IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence small overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions.

Cosmid clot is overlapped at the 5' end by cosmid clF3 and at the 3' end by cosmid c22F3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /product="putative golgi peripheral membrane protein"

Arabidopsis thaliana chromosome I BAC F915 genomic sequence Direct Submission Submitted (01-FEB-2000) The Institute for Genomic Research, 9712 Medical Center Dr., Rockville, MD 20850, USA Address all correspondence to:at@tigr.org BAC clone F915 is from Arabidopsis chromosome I and is near the molecular marker m213. The orientation of the sequence is from SP6 to T7 end of the BAC 01-FEB-2000 ACU22334 . 40333 DP DNA , FLIN OF OF ALABOLODS SHOWING SEQUENCE, Arabidopsis thallana chromosome I BAC F915 genomic sequence, ||||||| | 16867 CCTCTGGCTTATTTTTTTTTAAAGTATTTAAAAGGAGGGTC 16910 16667 AGCAACACAGTACTTACTCTGAAGCTTTAGAAGTGGCCAAAAAAGCTGGT 16716 733 oLeuPheSerProAsnPheSerGlu...LysValGlyValAlaPheAspH 749 ysThrHisSerThrThrSerGlnAlaIleSerValGlyMetArgMetAsn 716 766 ProLeuLysAlaLeuPheAlaGlyAspIleGluGluMetGluGluArgAr 782 749 isMetLysValCysPheGlyAspPheProThrMetProLysLeuIlePro DNA AC022354.1 GI:6850338 (bases 1 to 46335) 46335 bp complete sequence. seq_name: gb_p11:AC022354 seq_documentation_block: thale cress. 16911 GGAT 16914 782 gGlu 783 Lin, X DEFINITION ORGANISM REFERENCE AUTHORS JOURNAL REFERENCE TITLE JOURNAL ACCESSION VERSION KEYWORDS SOURCE 200 AUTHORS TITLE COMMENT

Genes were identified by a combination of three methods: Gene prediction programs including GRAIL (available by anonymous ftp from arthur.epm.ornl.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/-chris/GENSCANW.html), and NetPlantGene (http://www.cbs.dtu.dk/netpgene/Chsnetpgene.html), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TIGR (http://www.tigr.org/tdb/at.at.html). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are

clone.

For the lattest information on annotation of this clone, please see http://www.kazusa.or.jp/kaos/cgl.bin/adg_graph.cgl?c=MYA6

Genes with similarity to proteins in the databases are described in protein similarity are described as 'unknown protein'.

The software programs used to predict genes include: Grail

(Informatics Group, Oak Ridge National Laboratory, http://compblo.orn.gov/Grail-1.3/),

GENSCAN (Chris Burge, MIT, http://ccr-081.mit.edu/GENSCAN.html),

NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of SplicePredictor (Volker Brendel, Stanford University, http://www.cbs.dtu.dk/services/NetGene2/) and SplicePredictor (Volker Brendel, Stanford University, http://genalin1.zool.lastate.edu/cgi-bin/sp.cgi).

Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Washington University School of Medicine, St. Louis, http://genome.wustl.edu/eddy/tRNAscan-SE/).

This sequence may not be the entire insert of this clone. It may be a sequence may not be the entire insert of this clone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /translation="MERGMNNGOSLWHSQSPKTPTTWLDRALSSRRPHSDADLSASGE

ACCESSION AP038611 AF038611. GI:2702410	Caenorhabditis elegans strain=Bristol N2. SM Caenorhabditis elegans Bikaryotta, Metazoa, Nematoda; Chromadorea; Rhabditida; Rhabditidae, Deloderinae, Caenorhabditie		Johnston, L., Jones, M., Kershaw, J., Kirsten, J., Laister, N., Latreille, P., Lightning, J., Lloyd, C., McMurray, A., Mortimore, B., O'Callaghan, M., Parsons, J., Percy, C., Rifken, L., Roopra, R., Saunders, D., Shownkeen, R., Smaldon, N., Smith, A., Sonnhammer, E.,	<pre>Staden,R., Sulston,J., Thierry-Mieg,J., Thomas,K., Vaudin,M., Vaughan,K., Waterston,R., Watson,A., Weinstock,L., Wilkinson-Sproat,J. and Wohldman,P.</pre>	$2.2\ \mathrm{Mb}$ of contiguous nucleotide sequence from chromosome III of C. elegans	Nature 368 (6466), 32-38 (1994) 3 94150718	 Z (Dases I to 22846) Sammons,L., Wohldmann,P. and Biewald,T. The sequence of C. elegans cosmid E0484 				Submitted by: Genome Sequencing Center Department of Genetics, Washington University,	St. Louis, MO 63110, USA, and Sanger Centre, Hinxton Hall	Cambridge CB10 IRQ, England e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk	NOTICE: This sequence may not be the entire insert of this clone. It may be shorter because we only sequence overlanning sections	once, or longer because we provide a small overlap between neighboring submissions.	This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone

Submitted (27-MAR-2000) to the DDBJ/EMBL/GenBank databases. Takuji Sasaki, National Institute of Agrobiological Resources, Rice Genome Research Program; Kannondai 2-1-2, Tsukuba, Ibaraki 305-8602, Japan (E-mail:tsasakidabr.affrc.go.jp, WRL:http://www.dna.affrc.go.jp, Rax:81-298-38-7461, Fax:81-298-38-7461, Fax:81-298-38-7461, The orientation of the sequence is from SP6 to T7 of the PAC clone. Genes were predicted from the integrated results of the Golomes were predicted from the integrated results of the colone. SplicePredictor (October1998 version). The genomic sequence was SplicePredictor (October1998 version). The genomic sequence was searched against the non-redundant database NRPPIRN, SMISSPROT, GENPERT, PDB) from MAFF DNAbank and the CNNA sequence database at RGP. Protein similarities of the coding regions were searched against the non-redundant december and sequence of P0431F01 clone has an overlap with P0485D09 clone at the 5' end. The sequence of this clone starts at the position 93,219 of P0485D09. This sequence of this clone starts at the position 93,219 of Detailed information on assemble quality together with annotation of this entry at http://www.dna.affrc.go.jp:82/genomicdata/GenomeFi	Coction/Qualifiers 1. 143209 /organism="Oryza sativa" /cultivar="Nipponbare" /cultivar="Nipponbare" /chomosome="1" /chomesome="1" /chomesom		DGLFPEPPAGGDAEKDGKKÕQAKKDDDLRSRGLCLVPVSCMPHLAADNDVVVGSDFWA AAGGGGGGAPDAGANLIR COMPLAADLIN COMPLAGNUE 2063. 21521, 23357. 23422, 24370. 24668, 25123. 25368, 28653. 29059, 29676. 29733, 31244. 31316, 31424. 31531)) /note="hypothetical protein" /codon_start=1 /protein_id="BAA92976.1" /forde=in_id="BAA92976.1" /forde=in_id="BAA92976.1" /forde=in_id="BAA92976.1" /translation="MNRNRKGTRRGRGSARAPGGGVRGEGVRAMAAARASTRWRPL PGAAGDEAGDGFWRREFONDITESSRLGRSPHELTYTVRSTRUBRTSMLSGGELKSSPL PGAAGDEAGOFWRREFONDITESSRLGRSPRINGSPELNGRPDNRR RGSPVDMGRKSTGALSCFVYLCSEPSPRIELTYTVRYRSTRUBRTSMLSGGELKSSPL VQQWWVGTGNSSSSINGSLRONDITESSRLGRSPENELPOOLILIAASSNSSPCL NIPEWNLSTGLIDDESMPHERSAAAYDFVGHGGAGDGILGASSPRSKERIG DATASSPRSCVTTSGLGSSMUDFSNTAAPAPAADEDEITRKHHAGQSDNSSEVKERIG DATASHUGTGNSSSSTRUBSSRLSRSPRIERTRRHAGGSDNSSEVKERIG DRITALHQUISPEGRALSYPYLGGCSANDPWQQQTVKPQAQPIHTWRWPCWAAAHD ATGARSCACARAAHRPGHSLRAASCRSKWSSLAABAATCRRAAPFRRRAAPRASPARRRTATP

human colorectal adenocarcinoma (colon cancer) cell line SW480. The CDNA clones can be used to generate antisense oligonucleotides which can be used for antisense therapy. Methods and products from the present invention can be used for identifying and/or classifying cancerous cells present in a human tumour, particularly in solid tumours, e.g. carcinomas and sarcomas, e.g. breast or colon cancers. The cDNA clones can be used for developing agents for the diagnosis and treatment of disorders involving unwanted cell proliferation, such as neoplasia, dysplasia or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Z79917 to Z80766 represent double stranded cDNA clones isolated from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1374
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes novel isolated Streptococcus pneumoniae polynucleotides (see 296173-296494) and their encoded proteins (see 785792-786182). The DNA, vectors and host cells described in the method of the invention are useful for the recombinant expression of the polypeptides. The polypeptides are useful for treatment or prevention of disease, or diagnosis of disease related to expression or activity of such a polypeptide. They can also be useful for treatment or methority of such an olinhibit or activate such a polypeptide. The polypeptides (or DNA encoding them, via gene therapy) are also useful for inducing an immunological response in a mammal. The antagonists are useful to inhibit such bacterial polypeptides. The polypeptides are particularly useful to identify antimicrobial compounds and antibiotics. They are also useful to determine their role in pathogenesis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Treatment; prevention; disease; diagnosis; gene therapy; screening; bacterial; antimicrobial; antiblotic; pathogenesis; infection; ss.

The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V5254) recorded on it, or a representative fragment or a sequence at least 95% identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO:1 to 391 (V52134 to V52524) are genomic fragments from Streptococcus pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic DNA library using as a process comprising: (a) screening a genomic DNA library using as a process comprising: (a) screening a genomic DNA library using as that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating mnNA, DNA or CNDA produced from an organism, amplifying nucleic acid molecules whose nucleotide sequence is homologous to amplification primers derived from the regment of the S.pneumoniae genome to prime the amplification and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the s.pneumoniae genome of commercial importance, or expression modulating

The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrelia infections in animals, and for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and therapy of T. pallidum infections, particularly syphilis

can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            615
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  802

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents an essential Staphylococcus aureus gene. The invention relates to a method for screening for an antibacterial agent. The method comprises determining if a test compound is active against the essential bacterial genes (A26850-A26956). The invention also includes a method for evaluating an agent for activity on the essential genes. Also included in the invention is the production of an antibacterial agent. The antibacterial agents of the invention are used to treat or prevent bacterial infections, particularly where caused by Staphylococcus aureus. The antibacterial agents are unlikely to be affected by known resistance mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Essential gene; Staphylococcus aureus infection; screening; prevention; antibacterial agent; bacterial infection; ss.

                                                                                                                                                                                                                                              X20248 to X20402 represent polynucleotide sequences isolated from Borerlia burgdorferi (Bb). Products derived from Bb can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of biosynthetic products, e.g. enzymes. Borrelia belongs to a family of motile, spiral-shaped bacteria called Spirochetes. Spirochetes are pathogenic in humans and Borrelia causes epidemic andemic relapsing fever, and Lyme borreliosis, more commonly known as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 910715 BP; 327171 A; 129646 C; 130753 G; 323091 T; 54 other;
                                                                                                                      New isolated Borrelia burgdorferi nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of infections, particularly Lyme disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          111717 ATTAATATCATAGGAACTGGAGGAACAAGGCCACTCCACAATAGATATT 111766

                                                                                                                                                                                                                                                                             This sequence represents an ATP-binding cassette (ABC) transporter operon from Pseudomonas fluorescens strain 33. The operon comprises 3 genes where the termination codon of the first gene overlaps with the initiation codon of the second gene. The sequences of the encoded proteins have 60, 44 and 46% homology respectively to the LipBCD proteins from Serratia marcescens. The novel gene and protein can give or increase the ability of a microbe for secreting a protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2099 AGCAAGCCGG...CGTGCAACTGATCCTGCGTTTGCCCCACGCTAC 2145

```
The M-delta-1 gene (T58899) codes for the mouse homologue (W11720) of Drosophila Delta, a protein that binds to Notch protein. It was bottd. by PCR amplification of CDNA derived from 8.5 to 9.5-day mouse embryos using primers (see also T59457-58) based on Delta and EGF-like repeat sequences. M-Delta-1 is primarily expressed in the presonatic mesoderm, central nevous system, peripheral nervous system, and kidney. Chick (T58897-58) and human (T59800, T59454) Delta-1 sequences have also been isolated. Delta-1 genes can be used in the prodn. of Delta polypeptides and (including antisense sequences) utilised in the treatment of disorders of cell fate or differentiation, such as cancer, and nervous system disorders, or to promote tissue regeneration and repair.
                                                                                                                                                                                                                     New vertebrate Delta protein, DNA and antibodies, - for treating and preventing cancer, nervous system disorders and for tissue regeneration

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      X30724 to X30946 represent genomic DNA sequences isolated from Streptococcus pneumoniae strain 0100993. These genomic DNA sequences encode the novel proteins given in Y11114 to Y11367. The proteins, isolated from Streptococcus pneumoniae, can be used in vaccines against streptococcal infections and in assays for identifying compounds that inhibit to activate the activity of the proteins. The antisgonists can be used to treat an individual having need to inhibit a bacterial protein. Vectors expressing the proteins can be used to induce a

Cased on homology with an Anabear species protein) is a ketoacy reductase HETN and the other protein is of unknown function. The DNA sequences of the invention were isolated from S. pneumoniae strain 0100933 (NCIMB 40794). The Streptococcus pneumoniae proteins of the invention can be used to identify compounds which interact with and inhibit or activate the activity of the proteins. Antagonists can be used to treat diseases caused by S. pneumoniae proteins, through genetic immunisation. They can also be used to induce an immunological response in a mammal by inoculation with the S. pneumoniae proteins or delivery of the encoding nucleic acids in a vector adequate to produce antibody and/or T cell immune responses to protect the animal from disease. The proteins can also be used to identify antimicrobial compounds which are proteins can also be used to identify antimicrobial compounds which are capable of inhibiting their bloactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian extracellular matrix proteins on in-dwelling devices or in wounds, to block protein-mediated mammalian cell invasion, and to block the normal progression of pathogenesis in infections initiated other than by the implantation of in-dwelling devices or other surgical techniques.
                                                                                This DNA sequence encodes two Streptococcus pneumoniae proteins. One
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        217 ......GGAG 220

The sequence is that of the rubella RA27/3 genome.

The nucleic acid can be used to identify further attenuated strains and determining whether specific attenuating mutation sites are present by comparison with the sequence of RA27/3. Such strains, and the nucleic acid sequence, are useful in vaccines against rubella virus, an important human pathogen. Whilst acute infection is usually benign, infection during early pregnancy can result in viral passage across the placenta and replication in the foctus, causing severe birth defects. Congenital rubella syndrome, CRS). Bight live attenuated rubella virus. Companital rubella syndrome, CRS). Bight live attenuated rubella virus vaccines to prevent CRS have previously been developed by serial passage through culture, and vaccine comprising the RA27/3 strain is the most commonly used. Genetic characterisation of RA27/3 strain is the most commonly used. Genetic characterisation of RA27/3 strain is the most commonly used. Genetic characterisation and to determine whether complications sometimes occurring after vaccination (e.g. chronic alloched by lead to identify after vaccination (e.g. chronic alloched by lead to identify after vaccination (e.g. chronic alloched by lead to identify attenuated planning acid may also be used to identify attenuating mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             also be used to identify specific attenuating mutation sites, by introducing RAZ7/3-specific nucleotides into a wild-type infectious clone (e.g. an existing infectious clone based on the Therien strain) and determining whether the resulting virus is attenuated. It may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /product= SP-ORF, virion structural proteins C,E2,E1

- useful for modulating Tryptic peptides (given in R75096-97) of purified rat SIII pl10 subunit were used to design probes (Q90588-39) used to screen a rat brain lambda-GEMZ cDNA ilbrary. Hybridizing clones were further screened by PCR using primers (Q90539-40). cDNA (Q90529) encoding the pl10 protein (R75358) was obtained. 6062 recegecacercecacecececececec......crcrrcarda 6099 6018 TCCACATCCCGGTGAAGCATGTGAGCACCCT.....ACCCCCAGCTTC 6061 6144 CAGACGTGCTTGAAGAACAGCAGGTGGCCTCCTCGACCGCCTCCGGGGG 6193 740 SerGluLysValGlyValAlaPheAspHisMetLysValCysPheGlyAs 756 756 pPheProThrMetProLysLeuIleProProLeuLysAlaLeuPheAlaG 773 773 lyAspileGluGluMetGluGluArgArgGluLysArgGluLeuArgGln 789 seq_name: /cgn1_8/gcgdata/geneseq/geneseqn/NA1995.DAT:Q90529 724 : HisPheSerGlnArgTyrAlaLysValProLeuPheSerProAsnPhe g, Sequence 3501 BP; 984 A; 860 C; 896 G; 761 T; 0 other; or ų Novel RNA polymerase transcription factor SIII the rate of transcription by RNA polymerase II.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   exon
```

Figure 3 (N80456) shows a portion of the genetic DNA sequence of R. contucides which encodes PAL. The gene of the invention preferably consists of a DNA sequence identical to, related to, derived from or complementary to the sequence of codons from the start codon to the stop codon in Fig 3, from which the six intron IVS1 to IVS6 have been deleted (see N82309). The gene from which introns have been deleted is prepd. by joining overlapping cDNA clones pPALI (Fig 5, N80457) and pPALZ (Fig 6, N80458). As the introns present in the natural PAL gene act as a barrier to the expression of PAL in coganisms other than R. toruloides, the gene can be used to produce PAL in a wide range of procaryotic and eukaryotic hosts. The feature table gives the positions of the introns and the positions of the first and last exons; the positions of the other exons can be considered from the positions of the introns. Genė encoding phenylalanine ammonia lyase – obtd. from a strain of R.toruloides by excising non-coding introns. 222 TGGTCT...TGCTCTTTCTTTGTCTTTACTTCTCACACACACACT 268 319 GGCAAACGGCGTCGCAAACCAGGCTGTCAATGGCGCCTCGACCA 368 369 ACCTCGCAGTCGCAGGTCGCACCTGCCCAACCCAGGTCACGCAGGT 418 74 euTyrValPheSerGluPheAsnArgTyrLeuPheAsnCysGlyGluGly 90 51 CysSerGlyGly......ProAsnThrValTyrLeuGlnVa 62 18 nGlyArgThrIleSerGlnAlaPro...AlaArgArgGluArgProArgL 34 Sequence 2987 BP; 504 A; 1106 C; 781 G; 595 T; 1 other; 2 TrpAlaLeuCysSerLeuLeuArgSerAlaAlaGlyArgThrMetSerGl 34 ysAspProLeuArgHisLeuArgThrArgGluLysArgGlyProSerGly Length: 896 Gaps: 46 Percent Identity: 20.424 Oram J, Minton NP; Align seg 1/1 to: N80456 from: 1 to: 2987 (PUBL-) PUBLIC HEALTH LAB (ANSO/) Disclosure; Fig 3; 43pp; English 86GB-0021626 121.50 0.319 42.522 Anson J, Gilbert H, alignment_block: US-09-434-382-2 x N80456 WPI; 1988-091814/13; Quality: Ratio: Percent Similarity: P-PSDB; P80278. 08-SEP-1986; alignment_scores

cDNA clones (T59993-95) respectively code for elongin C, elongin B and elongin A (W13847-49), the 15 kDa, 18 kDa and 110 kDa subunits of rat Elongin, an RNA polymerase transcription factor which increases the rate of transcription elongation by RNA polymerase II. Elongin A cDNA was amplified from a rat brain cDNA library using primers (T6005-60) based on tryptic peptides (W13859-60) of the isolated subunit. The cDNA clones are useful for the recombinant prodn. of Elongin. Human Elongin cDNA clones (see also T59996-98) have also been isolated. DNA encoding RNA polymerase transcription factor, Elongin, 15, 18 and 110 kDa subunits - used to modulate transcription rate of RNA 341 AGGATTTTGAGAAGAGCAATTCCCGCAAGCGTCCCCGAGATGTTCCCCAG 390 spAsnIlePheLeuThrArgMetHisTrpSerAsnValGlyGlyLeuSer 122 123 GlyMetIleLeuThrLeuLysGluThrGlyLeuProLysCysValLeuSe 139 rGlyProProGlnLeuGluLysTyrLeuGluAlaIleLysIlePheSerG 156GTAGAACGAAACAATGAGGCT........GAGGATC 340 156 lyProLeuLysGlyIleGluLeuAlaValArgProHisSerAlaProGlu 172 .GlyValGlnArgLeuMetGlnGluHisLysLeuLysValAlaArgLeuA 106 44 GluLysArgGlyProSerGlyCysSerGlyGlyProAsnThrValTyrLe 60 29 43 heSerGluPheAsnArgTyrLeuPhe.....AsnCysGlyGlu 89 13 GlyArgThrMetSerGlnGlyArgThrIleSerGlnAlaProAlaArgAr 29 gGluArg.....ProArgLysAspProLeuArgHisLeuArg.ThrArg 60 uGlnValValAlaAlaGlySerArgAspSerGlyAlaAlaLeuTyrValP Sequence 3501 BP; 981 A; 861 C; 896 G; 762 T; 1 other; Length: 763 Gaps: 38 Percent Identity: 19.528 AGAGACCTGGTTGCCCAGTGGAAGAAGCTGGTTCCA to: 3501 219 TGGGGTGGGGAAAACAGTG.....
